education

B.S.E Computer
Science Engineering
ITESM Monterrey
GPA: 4.0

programming

Proficient: C++, Go
Familiar: Python, Java

languages

English professional
proficiency
Spanish mother tongue
French basic

experience

Summer-2018

Google

Software Engineering Intern
Google Search

Mountain View, California

- Built the backend infrastructure for a user interface on Google's new food ordering service to collect feedback on their previous order.
- Through this project, the team gains highly valuable insight on how restaurants' food is, as well as how Google's partners perform on delivery and pickup service. This will be useful for partner ranking, as there is no way to do that currently.
- Designed and built backend APIs and RPCs to fetch, encrypt and decrypt user feedback and the information necessary to display said feedback. Saved said information in a database and internal logs.
- Rearranged the team's Spanner cloud database into a more efficient schema and migrated all data. Added necessary tables for feedback.
- Built a real-time dashboard to show and search for feedback results, restaurant and partner ratings, as well as a section for negative experiences. Integrated a previously existing dashboard that showed amount of orders with this one to make a general location for all of the team's useful information.

Summer-2017

Google

Engineering Practicum Intern
Google Cloud

Mountain View, California

- Designed and implemented a multithreaded GRPC load generator and scheduler server, that increased network performance by 31%.
- Performance tuning for next generation network systems.
- Designed distributed system algorithms for network routing and traffic scheduling in very large scale networks.
- Created HTML for the information of a daemon that runs on every Google machine, to make it universally accessible and useful. This was only possible to query via RPC previously.

projects

HackMTY

No Hands Hacker -- Finalist

Fall 2017

- github.com/EduardoHi/No-Hands-Hacker
- Web app for fluidly developing and interpreting python using voice as text input.
- I created an algorithm for the text to speech webkit, so that it could understand Python and code semantics.
- I worked with Angular 2 to create the frontend and integrate it with our text editor.
- Implemented the backend as a RESTful API based on node.js and Express.js.

ML Week

Beer ML

Fall 2018

- github.com/kawer/BeerML
- iOS application uses Coreml and a convolutional neural network model in order to predict several types of beer bottles and cans.
- The current version has a trained model with approximately 1,700 images and 7,000 iterations.
- Used Turicreate to create the model.
- Labeled images and created python script to automatize translating XML and JSON into Turicreate format.
