PROGRAMMING

Proficient

- Go
- Python

Basic

- C++
- Haskell
- Swift
- Java

LANGUAGES

- English: Professional proficiency
- Spanish: Native
- French: Basic

EXPERIENCE

APPLE | AI/ML ENGINEER INTERN | SIRI SEARCH

Summer 2019 | San Francisco, CA

- Improved the experience of Siri Knowledge Cards in Spotlight by expanding the number of categorized entity types and identifying the most relevant facts for each category using Hive and Impala, increasing entity type coverage by 214%
- Built an automation pipeline to analyze query logs and obtain the most searched facts per entity type in order to automatically update inline cards every month based on user behavior.
- Collaborated with our ontology team to integrate a new organization-wide ontology model into our entity categorization logic.
- Integrated the produced dataset into our query runtime and ran AB experiments and offline analysis to evaluate our result quality.
- AB results showed an increase of 35% in positive abandonment rates and of 7% in engagement rate, which was the ideal outcome. This means people find the information they were looking for more quickly and are more interested in what is shown now.

GOOGLE | SOFTWARE ENGINEERING INTERN | GOOGLE SEARCH

Summer 2018 | Mountain View, CA

- Built backend infrastructure for a new food ordering service, allowing the team to collect feedback on users' previous orders, providing valuable insights on restaurant quality and partners' performance on delivery and pickup service, in order to inform partner ranking.
- Designed and built backend APIs and RPCs to fetch, encrypt and decrypt user feedback and the information necessary to display said feedback.
- Rearranged the team's Spanner cloud database into a more efficient schema and migrated all preexisting data. Modified and created necessary tables for the team's ML group to ingest feedback data.
- Built a real-time dashboard to show and search for feedback results, restaurant and partner ratings, as well as a section for negative experiences. Integrated a previously existing dashboard that showed amount of orders with this one to make a general location for all of the team's useful information.

GOOGLE | SOFTWARE ENGINEERING INTERN | GOOGLE CLOUD

Summer 2017 | Mountain View, CA

- Designed and implemented a multithreaded GRPC load generator and scheduler server, that increased network performance by 31%.
- Implemented performance tuning for next generation network systems resulting in lowered package loss.
- Designed distributed system algorithms for network routing and traffic scheduling in very large scale networks for testing fibre performance under high traffic.
- Created a dashboard for displaying the information of a scheduling daemon that runs on every Google Cloud server machine, to make it universally accessible and useful. This information was only obtainable via RPC queries previously.

PROJECTS

BEER ML | iOS MOBILE APP

Fall 2018 | Machine Learning Week Competition Winner, MTY Mexico

- github.com/kawer/BeerML
- Created an iOS application that uses CoreML and a convolutional neural network model built using Turicreate in order to identify several brands and types of beer bottles and cans in real time.
- Trained the model with approximately 1,700 images and ran 7,000 iterations.
- Labeled images and created python scripts to automatize translating XML and JSON into Turicreate format.
